Fuel Treatment Specialist – fuel and tank cleaning process*

Fuel & Tank Cleaning

Remember this: Unless the mass of sludge on the tank bottom and side walls are removed, it will recontaminate fresh fuel every time the tank is filled. The bugs must be eradicated from the tank system. FuelT_s accomplishes this by using proprietary FuelTreat Biocides in conjunction with proprietary tank cleaning processes.

FuelT_s **Fuel and Tank Cleaning 4 Step Process** works as follows:

Step 1: Remove the sludge accumulated on the tank bottom. The majority of the sludge is in the water at the bottom of the tank. Unlike our competitors, the FuelT_s process does not involve removing all of the fuel from the tank, physically cleaning the tank, and then placing the removed fuel back into the tank. The FuelT_s focuses on where the sludge is – at the tank bottom. The majority of the sludge is removed directly from the tank bottom and separated out into drums for disposal.

Step 2: Biocide the remaining dispersed bug sludge mass with a high speed pump scouring the tank walls at the same time. With the right biocide concentration, the bugs are killed and lying on the tank bottom.

Step 3: Repeat Step 1, removing the sludge mass from the tank bottom into drums.

Step 4: Polish the biocide fuel through low micron filters while injecting additives to bring the often off-spec fuel into specification, ready for consumption.

The FuelT_s process is quick, efficient, and normally does not require that the fueling facility be closed during our proprietary fuel and tank cleaning process. Our unit is self contained, requiring no power and other utilities from the host facility. Our unit is compact and mobile, reaching tanks in isolated parts of a facility. Cleaning with biocide treatment cost far less than disposing of all the fuel in tank and replacing it with fresh fuel.

When Quality & Service Make a Difference
